## **Version 2.5**

last update 1/20/2012

## **Based on Game Version: 1.1.1.1**

This Manual is created and tested under the conditions of the latest Patch 1.1.1.1

## A-10C Cockpit Cold and Dark, wake it up.

### Step 1

Loc: Right Console

PNL: Electrical Control Panel (5)

First step is to provide (Battery) Power on the Systems by switching the

**Battery Power switch** to PWR  
and the  
**inverter switch** to STBY

Since Patch 1.1.0.8 a new Sound environment was added which represents the Batteries working.

### Step 2

Loc: Left Console

PNL: Auxiliary Lightning Control Panel (5)

Perform a lightning test by press and hold the

**Signallights Lamptest Button**

### Step 3

Loc: Right Console

PNL: Oxygen Control Panel (5)

Set the **Oxygen Regulator Switch** from OFF to ON

### Step 4

Loc: Right Console  
 PNL: Environment Control Panel (10)

Perform a check of the **Oxygen supply system** by pressing and hold the **Oxy IND Test** Button. Watch for the **Oxy Low** warning lights when the level gets to **0.5 l**

### Step 5

Loc: Front Dash  
 PNL: Fuel quantity Indicator (47)

Perform a **Fuel Quantity Indicator** Function test by pressing and hold the **Test IND Button**. The Indicator will indicate at least 3000 LBS.

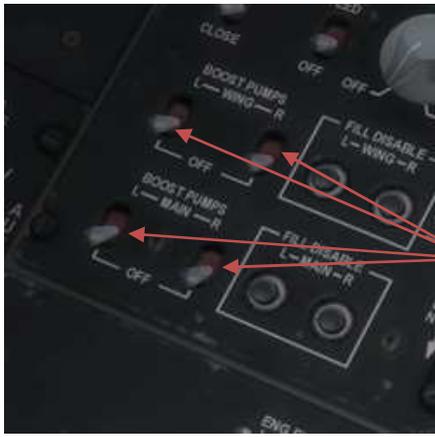

### Step 6

Loc: Right Console  
 PNL: Electrical Control Panel (5)

After now all Systems have checked for it's functionality, it's time to prepare the Engine start up. So switch the both **AC GEN switches** to the **PWR** position. This will provide Power to the System once **both Engines** are running.

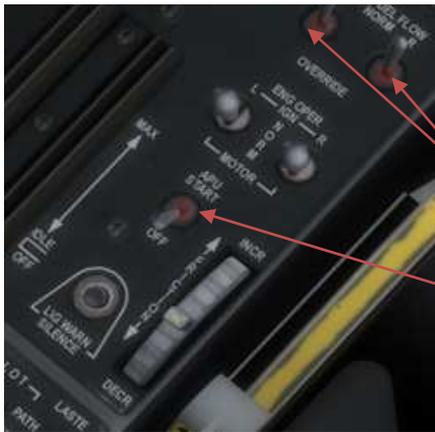

By switching the left **AC Gen Switch** to PWR a master Caution alert will occur, that's but normal.

### Step 7

Loc: left Console  
 PNL: Fuel System Control Panel (3)

activate the **Main-** and **Wings Boost pumps**

### Step 8

Loc: left Console  
 PNL: Throttle Quadrant (7)

Make sure that both **FUEL FLOW** switches are set to **NORM**. Once it's checked...

...Start up the **APU**

### Step 9

Loc: Front Dash  
 IND: APU Tachometer (44)

Watch the APU Tachometer. It has to reach 100%.

### Step 10

Loc: Right Console  
PNL: Electrical Control Panel (5)

*APU* is running now. So now set the *APU GEN Switch* to PWR, to enable the generators to provide Power to the Avionics and Engines to start up.

### Step 11

Loc: Right Console  
PNL: Avionics Auxiliary Panel (21)

Provide Power to the *CDU* by set the *CDU Power Switch* and the *EGI Power Switch* to the ON Position

After that turn the *STEER Pt Dial* to the FLT PLAN Position.

### Step 12

Loc: Right Console  
PNL: Control Display Unit (CDU) (20)

Once *EGI* and *CDU* Switches have been set to ON *INS GROUND ALIGNEMENT* will start automatically. It's not necessary to set up *CDU* at this point, but it'll saving time since *INS ALIGNEMENT* takes round about 4 Minutes. You'll save a lot of time at this point of the startup, yet without running engines.

*INS alignment* has finished once the Display indicates T= 4.0 0.8

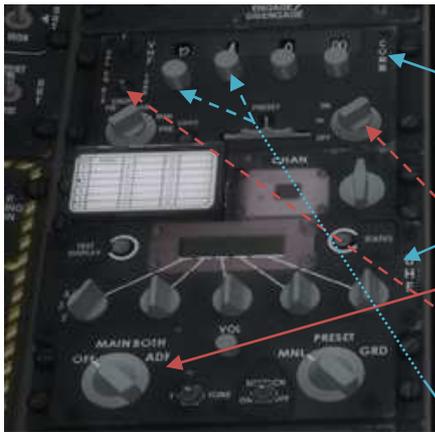

### Step 13

Loc: Left Console

PNL: VHF/FM Radio Control panel (13)

Turn the **Transmission Dial** to **TR**

Perform a **function test** by clicking the **squelch**. That should cause a **TRANSMISSION SOUND**.

### Step 14

Loc: Left Console

PNL1: VHF/AM Radio Control panel (10)

PNL2: UHF Radio Control panel (12)

On the **UHF Panel**, turn the **UHF Radio Power Dial** to **MAIN**

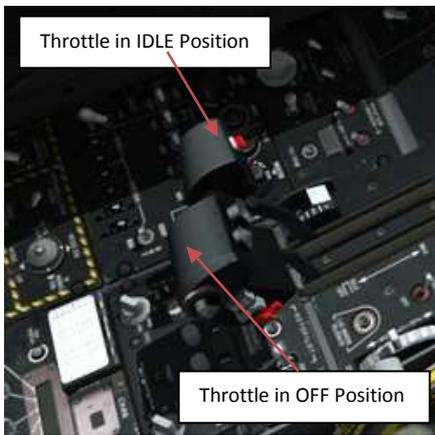

On the **VHF/AM Panel** set the **Transmission Dial** to **TR** and perform a **SQUELCH Test** (Transmission sound)

Now get to the Manual on **PAGE 657** „**Airdromes data**“ and get respective Frequency (Tower Comm) of the Airfield where you are.

Adjust the **VHF/AM** Radio and request start up on ATC (**MIC switch Forward** / *Alt left + (Numpad) +*).

Frequencies are provided in the manual on Page 657. I suggest to get the **GROUND CHARTS** provided by the **Virtuelles Jagdbomber Geschwader 32** on the ED Forums

(<http://forums.eagle.ru/showpost.php?p=1193082&postcount=1>)

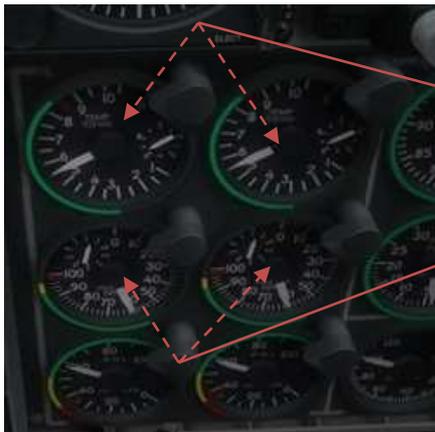

## Step 15

Loc: Left Console

PNL: Throttle Quadrant (7)

To start the engines, move the throttles from **OFF** to **IDLE**, or press *Home + Right Alt* key for left and *Home + right CTRL* key for the right engine to move. The respective Engine starts to turn on.

## Step 16

Loc: Front Dash

IND1: Interstage Turbine Temperature Indicator (left & right) (39)

IND2: Engine Core Speed Indicator (left & right) (40)

Watch the **Interstage Turbine Temperature Indicator** and the **Engine Core speed indicator**. The engines are finally running in Idle once the indicator needles are no more moving.

## Step 17

Loc: Right Console

PNL: Canopy Control Switch (2)

It becomes quite loud in the Cockpit while the Engines run up. So close the Canopy by rightclick and hold the **Canopy Control Switch** until the Canopy is closed.

## Step 18

Loc: Left Canopy bow

PNL: None (2)

The **Accelerometer** needs to be reseted to provide correct G-loading on the aircraft. Just press the **Reset Button** to do this.

This is not a must. Real life Pilots like to forget this as well...

## Step 19

Loc: left Console

PNL: Throttle Quadrant (7)

Shut down the **APU** on the left Console

After that set the **APU Gen Switch** back to **OFF**

## Step 20

Loc: Right Console

PNL: Lighting Control Panel (15)

Set all the **Light Switches** in the opposite direction.

Then use the **Pinky Switch** to adjust the Lights:

(A DETAILED DESCRIPTION CAN BE FOUND ON PAGE 158 IN THE MANUAL)

After that play around with the **Cockpit illumination dials**. You'll see what happens when turning them, so no further explanation here.

## Step 21

Loc: Right Console

PNL: Countermeasures Set Signal processor (23)

Set **CMS DIAL** to **SEMI** or **AUTO**. To set up the proper Program and/or how to use **ECM** is detailed explained in the manual on [PAGE 400](#).

Do not set the JTSN switch as shown in this image, otherwise you'll dispend all your flares.

## Step 22

Loc: Front Dash

PNL: Armament HUD Control Panel (18)

After providing power to **EGI** and **CDU** activate **CICU** and **IFFCC** on the **Armament HUD Control Panel (AHCP)**.

### **Important Note:**

Set **IFFCC** to **TEST** in the first step only!

## Step 23

Loc: Front Dash

PNL: Up Front Controller (UFC) (36)

Once **IFFCC** Switch has been set you need to engage **Preflight BIT Test**. This is not important at this point but recommended, cause it takes a while

On the **HUD** you'll be tasked to engage the **Preflight BIT Test**. To enable the **BIT Test** click on the **Enter Button** on the **UFC**.

The BIT Test will take aprox 1 Minute and is been indicated as finished once you can hear „**pull up, pull up, altitude, altitude**“!

## Step 24

Loc: Front Dash

PNL: MFCD (left and right) (29)

Provide Power to the **MFCD's** by turning the **Power knob** from **OFF** to **DAY** (if it's at night of course set it to Night (NT) to avoid cross fades caused by the Night Vision Goggle.

**IFFCC** needs a while to load all needed Datas (*approximately 1 Minute*). Once this Process has finished the **HUD** will provide several selections. But until the **IFFCC** has finished, we're going on to manage the **Flight Control Systems**.

## Step 25

Loc: Left Console

PNL: Stability Augmentation System (SAS) Panel (18)

Adjust the Flight Control System by setting the **YAW** and

**Pitch Switches** from **OFF** to **ENGAGE**

Next is to press the **T/O TRIM** Button

### Step 26

Loc: Front Dash  
 IND: Standby Altitude Indicator (SAI) (20)

Uncage the **SAI** by right click and hold/turn the **Cage knob**. The red **OFF Warning Flag** will release and the Indicator can be adjusted up and down to cover with the Artificial Horizon.

This Indicator is a backup instrument and would only be used in case the ADI fails<sup>3</sup>

### Step 27

Loc: Front Dash  
 PNL: Multi Function Colored Display (MFCD) (29)

While **BIT Test** is running

On the **MFCD** appears the **DTS UPLOAD** Screen.

Load all Datas in the System by pressing the **Option Select Button (OSB) 6** on the left MFCD

### Step 28

Loc: Front Dash  
 PNL: Multi Function Colored Display (MFCD) (29)

DTS Upload has been finished once these tiny dots appear next to the Load options.

Once the upload is finished press **OSB 13 (CDU)** to take the CDU page on the **right MFCD (CDU repeater)**

<sup>3</sup> Page 96 Flight Manual

### Step 29

Loc: Front Dash

PNL: Multi Function Colored Display (MFCD) (29)

**INS alignment** has already finished (depends on how fast you are and whether or not you take time for setting up DSMS (Weapon Configuration))

After that press **OSB 9** to switch to the navigation Mode.

### Step 30

Loc: Front Dash

PNL: HUD /UFC (4/36)

BIT Test has been finished, so exit by pressing the **ENT Button** on the **UFC**

### Step 31

Loc: Front Dash

PNL: HUD /UFC (4/36)

Now several Options are provided. But these are not important at the moment. So navigate to **EXIT** by pressing the **Select Button** on the **UFC**. Execute by pressing the **ENT Button**

### Step 32

Loc: Front Dash  
PNL: HUD /UFC (4/36)

The next menu will provide a bunch of Options again. Only thing you may do now is to set up the Bomb mode you prefer or which is the best according to your weapon loadout.

CHECK PAGE 357 IN THE MANUAL FOR FURTHER INFORMATION ABOUT **CCIP** CONSENT OPTIONS

Navigate by using the **SELECT Switch** and select the mode by using the **DATA Switch**.

### Step 33

Loc: Front Dash  
PNL: HUD /UFC (4/36)

By the end of that process set the **IFFCC Toggle** on the **Armament HUD Control Panel** to **ON**. This will display the **HUD** properly.

**JTRS** (Joint Tactical Radio System) switch needs to be set in the **ON** position.

### Step 34

Loc: Front DASH (Behind the Stick)  
PNL: NAV Panel / TISLE Control Panel (49)

Switch from **HARS** to **EGI**.

That's important to enable **EAC**

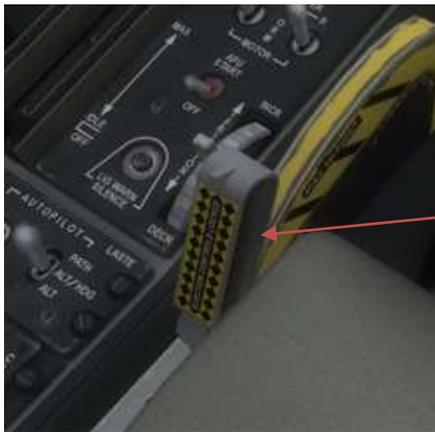

### Step 35

Loc: Left Console  
PNL: LASTE Control Panel (9)

Set **EAC Switch** to **ARM** and  
**RDR ALTM Switch** to **NRM**.

DETAILED INFORMATION ABOUT EAC ARE PROVIDED ON PAGE 49 IN  
THE MANUAL.

### Step 36

Loc: Ejection Seat  
PNL: NONE

Arm the Ejection seat

### Step 37

Loc: Left Console  
PNL: Throttle Quadrant (9)

Set the **Flaps Toggle** in the **FIRST POSITION** for Take Off  
and in **SECOND POSITION** for Landing.

## Step 38

Loc: Front Dash

PNL: switches are not part of a certain panel (30/31)

Set the **Anti Skid Switch** and activate Taxi lights by right click the **Taxi-/Landing lights switch**.

*Recommendation:*

Set Taxi light switch to the landing position after take off, to avoid struggling with the knobs while in landing process. Landing and Taxi lights are different.

Once you're confident with the start up procedure, so you can start to create your own procedure.

The way I was explaining is just one of a bunch.

### **closing words**

Start up Procedure is finished now. For Weapons use go through the Manual or search for further Community based manuals, ideally use the tutorial Collection on one of the both Wiki resources.

Eagle Wiki:
